

Tags of typography: All tags discussed here are container tags.

8. Font: Font is a popular tag in HTML. It works for formatting the text up to some extent. We can set a particular font and a particular color for the text.

 tag is used with following two attributes:

a) face: its value can be any font name like- Calibri, Times New Roman etc.

syntax:

```
<p><font face="monotype corsiva">India</font></p>
```

India

b) color: its value can be any color name like- red, green, blue, pink etc.

syntax:

```
<p><font color="pink">India</font></p>
```

India

Collectively, the syntax is like:

```
<p><font face="monotype corsiva" color="pink">India</font></p>
```

India

Colour specification in HTML: Colour in HTML is not exactly 'colour'; it's actually 'color'. HTML works on American accent hence accepts the spelling 'color'. It doesn't work on British accent hence 'colour' is of no meaning to it.

Colours are accepted in the following three ways:

- Colour name ex.- red, pink, blue, green, maroon etc.
- Colour Hex Code ex.- ff0000, 00ff00, 0000ff, 000000, ffffff etc.
- Colour RGB values used in CSS.

Colour Hex Code: It is a 6-digit hexadecimal code defining a particular colour. The range starts from '000000' and ends at 'ffffff'. A list of some hex codes is given in the table.

Colour	Hex Code	Colour	Hex Code
White	ffffff	Black	000000
Red	ff0000	Green	00ff00
Blue	0000ff	Yellow	ffff00

Assignments:

1. What are different attributes used with tag?
2. What are the different ways to add colors in HTML?
